

# Universal, Off-Line, High Brightness, 350mA LED Driver Demoboard

## General Description

The Supertex HV9910BDB2 demoboard is a High Brightness LED power driver to supply a string of LEDs using the HV9910B IC from a universal AC input. The HV9910BDB2 can supply a maximum output current of 350mA to drive 10 - 40V LED strings from a wide input voltage - 90 to 265VAC, 50/60Hz.

The power conversion stage of the HV9910BDB2 consists of a diode bridge rectifier, followed by a current-controlled buck converter operating at a switching frequency of 50kHz. The nominal output current of the demoboard can be adjusted to any value between 30 and 350mA using the on-board trimming potentiometer. PWM dimming can be achieved by applying a pulse-width-modulated square wave signal between the PWMD and GND pins. Zero output current can be obtained only by PWM dimming.

The HV9910BDB2 is not CISPR-15 compliant. Additional filtering is required to make the board meet CISPR-15 limits.

## Specifications

Parameter	Value
Input voltage	90 - 265Vrms, 50/60Hz
Output voltage	10 - 40V
Output current	350mA max
Output current ripple (typ) @110V input	25% (peak-peak) @40V output, 350mA
Full load efficiency	88% @110VAC
	86% @230VAC
Power factor	0.70 @110VAC
	0.48 @230VAC
Input current (rms)	0.20A @110VAC
	0.14A @230VAC
Input current THD	94% @110VAC
	95% @230VAC
Switching frequency (typ)	50kHz
Minimum output current	20mA @110VAC
	30mA @230VAC
Open LED protection	yes
Output short circuit protection	no
Dimensions	68.6mm X 49.6mm

## Connection Diagram

### **WARNING!!!**

**Do not connect earth-grounded test instruments. Doing so will short the AC line, resulting in damage to the instrument and/or the HV9910BDB2. Use floating high voltage differential probes or isolate the demoboard by using an isolating transformer.**

**There is no galvanic isolation. Dangerous voltages are present when connected to the AC line.**

## Connections

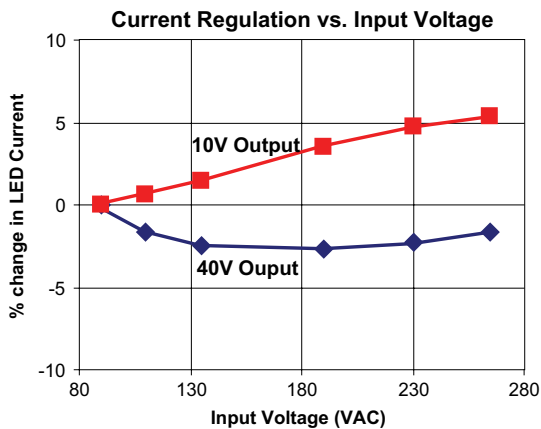

1. Connect the input AC voltage between the AC IN terminals as shown in the connection diagram.
2. Connect the LED string between LED+ (anode of LED string) and LED- (cathode of LED string).
3. Connect the PWMD terminal to the VDD terminal using the jumper provided to enable the LED driver.
4. The current level can be adjusted using the on-board potentiometer.

## PWM Dimming

The HV9910BDB2 is capable of being PWM dimmed by applying a square wave TTL compatible signal between PWMD and GND terminals. However, since there is no galvanic isolation on the board, care must be taken to prevent damage to the PWM dimming source and/or the HV9910BDB2. One simple way is to isolate the LED driver from the AC line using an isolation transformer. Another approach is to use an opto-isolator to drive the PWMD pin as shown in the figure below.

## Typical Results

Waveforms

Steady State waveforms at 110VAC input and full load output

Steady State waveforms at 230VAC input and full load output

Steady State waveforms at 90VAC input and 40V, 350mA output

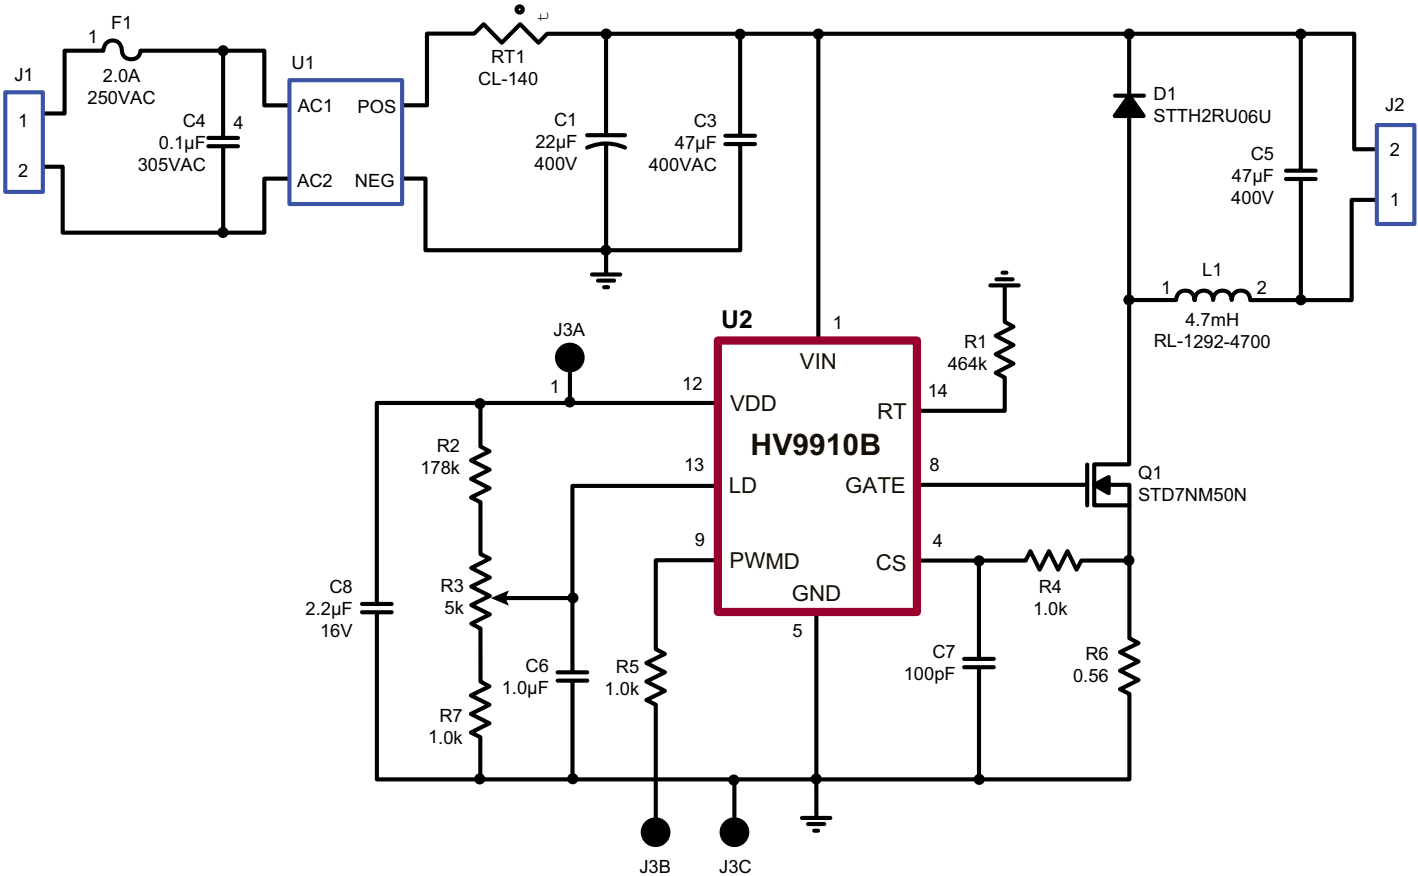

Steady State waveforms at 230VAC input and 10V, 350mA output

Silk Screen
